

Ogden City to Begin Critical 36-Inch Water Pipeline Replacement Across Pineview Reservoir

Drought conditions have created a rare window for the installation of a critical water transmission pipeline that serves 120,000 water users. Water levels will be lowered sufficiently to allow construction to begin in November.

OGDEN, Utah — Ogden City today announced plans to begin construction to replace the Ogden Canyon 36-Inch Water Transmission Pipeline Replacement Project crossing Pineview Reservoir. This section connects the pipeline from the Port Ramp Marina under the reservoir to the wellfield. This is a critical infrastructure investment that will protect reliable drinking water service for more than 120,000 residents throughout the region. Since early 2025, crews have been replacing pipeline from Pineview Reservoir through Ogden Canyon.

The existing pipeline has been in service for approximately 60 years beneath Pineview Reservoir and nearly 100 years through Ogden Canyon. It is currently estimated to upwards to one million gallons of treated drinking water per day and is reaching the end of its service life. Replacement is essential to protect water system reliability and prevent failures that could interrupt service across the region.

The distinction between what the drought is doing to Pineview Reservoir and what this project requires is important. Utah's 2025–2026 water year has produced the lowest statewide snowpack on modern record, and Pineview Reservoir is already projected to reach historically low levels this summer independent of this project. Rather than drawing from other interconnected regional water sources, the project team will take advantage of naturally lower drought-driven levels to complete the work. Water will be preserved as storage in other reservoirs and minimizing disruption to the broader regional water system. Any additional water released from the reservoir to complete construction will be reclaimed downstream in Willard Bay.

[QUOTE PLACEHOLDER — Justin Anderson, Public Utilities Director, Ogden City. Suggested themes: community responsibility, infrastructure investment, once-in-a-generation timing, commitment to reliable water service.]

— Justin Anderson, Director of Public Utilities, Ogden City

The project does not require draining Pineview Reservoir. Crews will lower water levels sufficiently to install the new pipeline alongside the existing one within the established right-of-way. The existing pipeline will remain in service during construction and will afterward be rehabilitated as a redundant backup line. This will give water managers two independent transmission lines for the first time. The \$100 million project is funded through the EPA's WIFIA program, the Drinking Water State Revolving Fund, and federal and state grants. Sunrise Engineering is the design engineer and Whitaker Construction is the contractor.

The project is being carried out in close coordination with federal and state water management partners who are in agreement with the construction approach. All reservoir release operations will be authorized and supervised in compliance with state and federal water rights law.

PROJECT FAST FACTS

- Pipeline age: ~60 years beneath Pineview Reservoir; ~100 years through Ogden Canyon; possible water savings recovered because of improved infrastructure: ~1,000,000 gallons per day
- Total project investment: ~\$100 million (all phases, 2025–2029)
- Reservoir capacity: 116,150 acre-feet (approximately 2,874 acres at full pool)
- Projected natural reservoir low this season due to drought: < 10% of capacity
- Construction approach: New parallel pipeline installed alongside existing pipe; reservoir is lowered, not drained. Water will be reclaimed through controlled release.
- Reservoir refill: Will begin by January 2027 (average snowfall season will completely refill the reservoir post-construction).

Ogden City recognizes that lower reservoir levels will affect recreation at Pineview Reservoir this season. The City has been in active coordination with recreation stakeholders, marina operators, and the Pineview Reservoir Yacht Club since early 2026.

ABOUT OGDEN CITY DEPARTMENT OF PUBLIC UTILITIES

Ogden City's Department of Public Utilities delivers safe, reliable drinking water to residents and businesses throughout the region. The department manages water treatment, transmission, and distribution infrastructure — including the 36-inch transmission pipeline from Pineview Reservoir through Ogden Canyon. The Ogden Canyon 36-Inch Pipeline Replacement Project is one of the most significant water infrastructure investments in the City's history.
